EDUCATION

New York University

Washington, DC

Liberal Studies Core; Intended Major: Computer Science and Mathematics (CAS)

Aug. 2026 – May 2030

- **Advanced Placement:** Computer Science A (5), Calculus BC (5), Physics C: Electricity & Magnetism (5)

PROJECTS

Asterlo | *TypeScript, Next.js, React, PostgreSQL, Gmail API, AI, Git*

Aug. 2026 – Present

- Building and actively developing an AI-assisted outreach platform that manages the email workflow from contact research and personalized message generation through human approval, sending, and reply handling; a functional MVP is deployed in production at asterlo.io, with a pilot-ready release targeted for the coming months.
- Implemented Gmail integration for OAuth authorization, outbound sending, reply synchronization, same-thread draft creation, hard-bounce detection, and suppression handling.
- Designed approval gates, campaign holds, and idempotent workflow controls to prevent unauthorized sends, duplicate processing, and continued outreach after replies or delivery failures.
- Built automated application and database tests and validated end-to-end workflows in an isolated Test environment, running formatting, linting, type checking, unit and integration suites, migration coverage, and secret scanning before every Production promotion.

Campus Decoder | *AI, Web Development, REST APIs, Git*

Sep. 2026

- Built and deployed an AI-powered web application that helps international students interpret unfamiliar U.S. college situations such as office hours, professor communication, and group-project conflicts.
- Integrated a large language model API to transform user-submitted scenarios into context-aware explanations and practical suggested actions.
- Designed and implemented the product independently from concept through deployment, including the user experience, application logic, and AI integration.
- Submitted the project to GatewayHacks 2026 and deployed it publicly at campusdecoder.com.

RepDay — Gym Workout Planner (iOS) | *Swift, SwiftUI, SwiftData, WidgetKit, Git*

May – Aug. 2026

- Designed, built, and shipped a native iOS workout planner published on the U.S. App Store, written in Swift and SwiftUI with SwiftData persistence across roughly 15,000 lines of code and 59 source files ([App Store](#)).
- Implemented planned and improvised training modes covering both strength sets and duration-based cardio, with concurrent independent rest timers, mid-session exercise editing, drag-to-reorder, and undo.
- Extended the app with a WidgetKit home-screen widget backed by a shared app-group data store, Apple Calendar sync through EventKit, local notification reminders, and training statistics rendered with Swift Charts.
- Delivered full English and Simplified Chinese localization and a privacy-first architecture that keeps all workout data on-device, with no account, advertising, analytics, or third-party tracking SDKs.

TypeRacerGame | *JavaScript, HTML/CSS, Git*

Dec. 2025 – Aug. 2026

- Developed and deployed a browser-based typing game with multiple difficulty levels and real-time typing feedback.
- Implemented persistent interface preferences and responsive gameplay behavior across sessions.

TECHNICAL SKILLS

Languages: Java, Python, JavaScript, TypeScript, Swift, HTML/CSS

Technologies: Git, GitHub, REST APIs, Gmail API, Next.js, React, PostgreSQL, SwiftUI, SwiftData, WidgetKit, Vercel

Developer Tools: VS Code, Cursor, Xcode, PyCharm, IntelliJ IDEA
